

# Rethinking Nonlinear Instrumental Variable Models through Prediction Validity

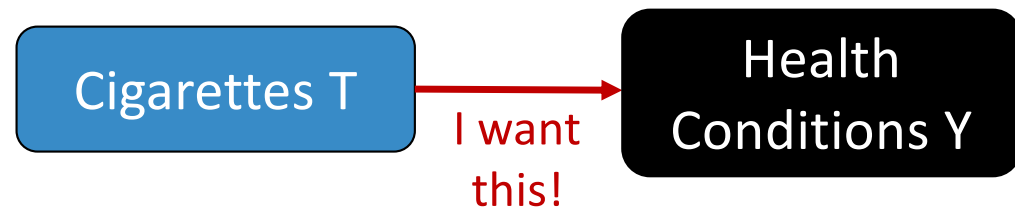

Chunxiao Li  
Cynthia Rudin  
Tyler McCormick

Instrumental variables are useful when would like to measure a causal effect but cannot perform an experiment.

Instrumental variables are useful when would like to measure a causal effect but cannot perform an experiment.

Instrumental variables are useful when would like to measure a causal effect but cannot perform an experiment.

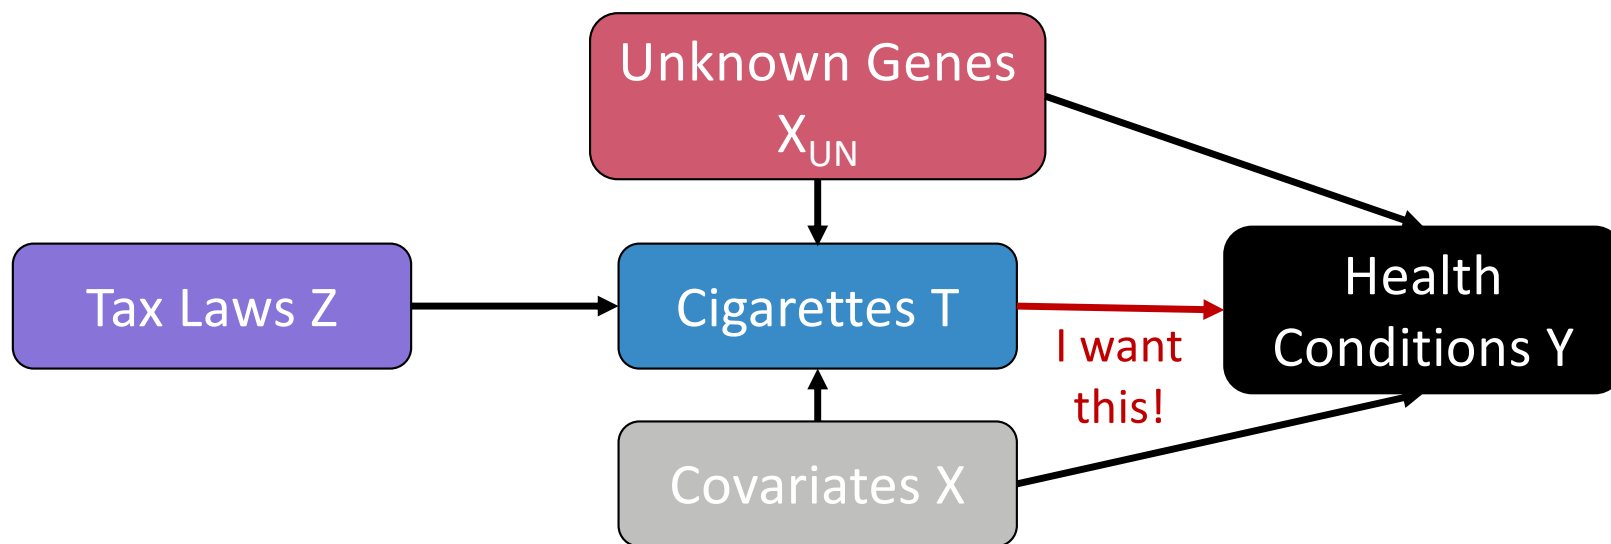

Instrumental variables are useful when would like to measure a causal effect but cannot perform an experiment.

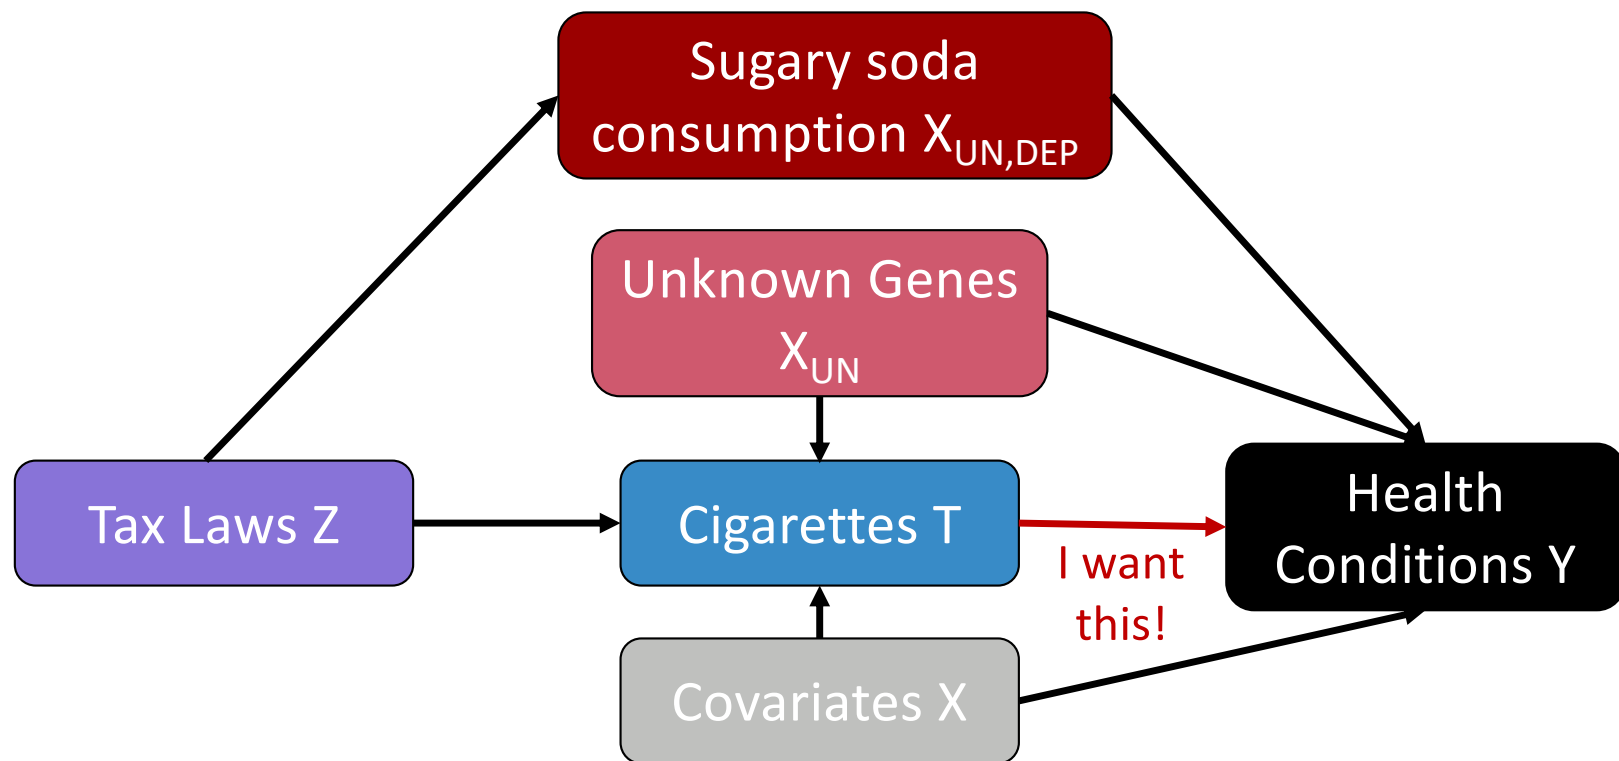

Instrumental variables are useful when would like to measure a causal effect but cannot perform an experiment.

Instrumental variables are useful when would like to measure a causal effect but cannot perform an experiment.

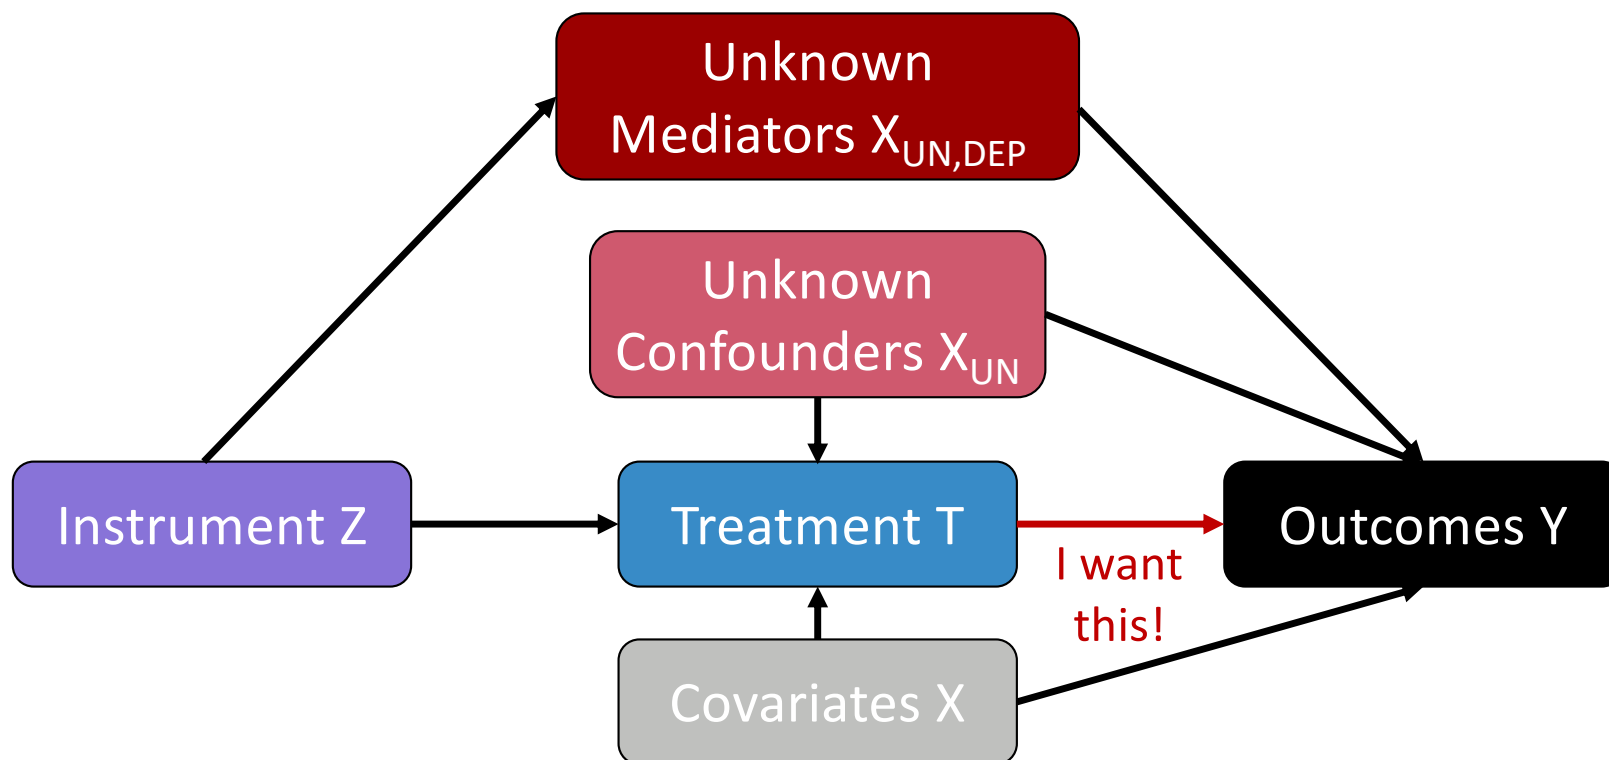

**Instrumental variables** are useful when would like to measure a **causal effect** but cannot perform an **experiment**.

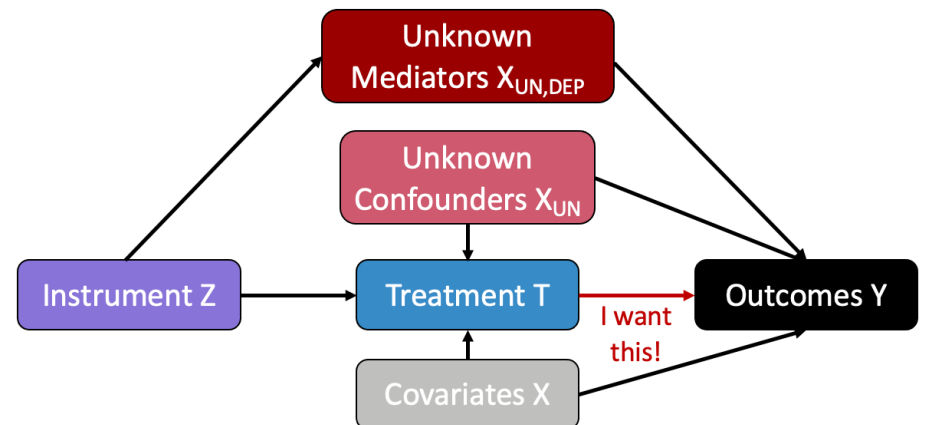

Instrumental variables are useful when would like to measure a causal effect but cannot perform an experiment.

Two Critical Assumptions:

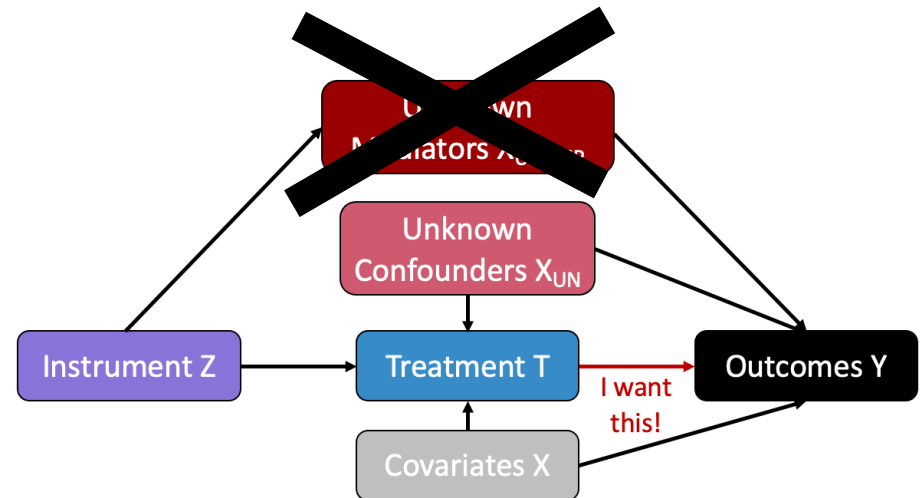

**Relevance Assumption:** variation in the instrument Z leads to meaningful variation in the treatment T

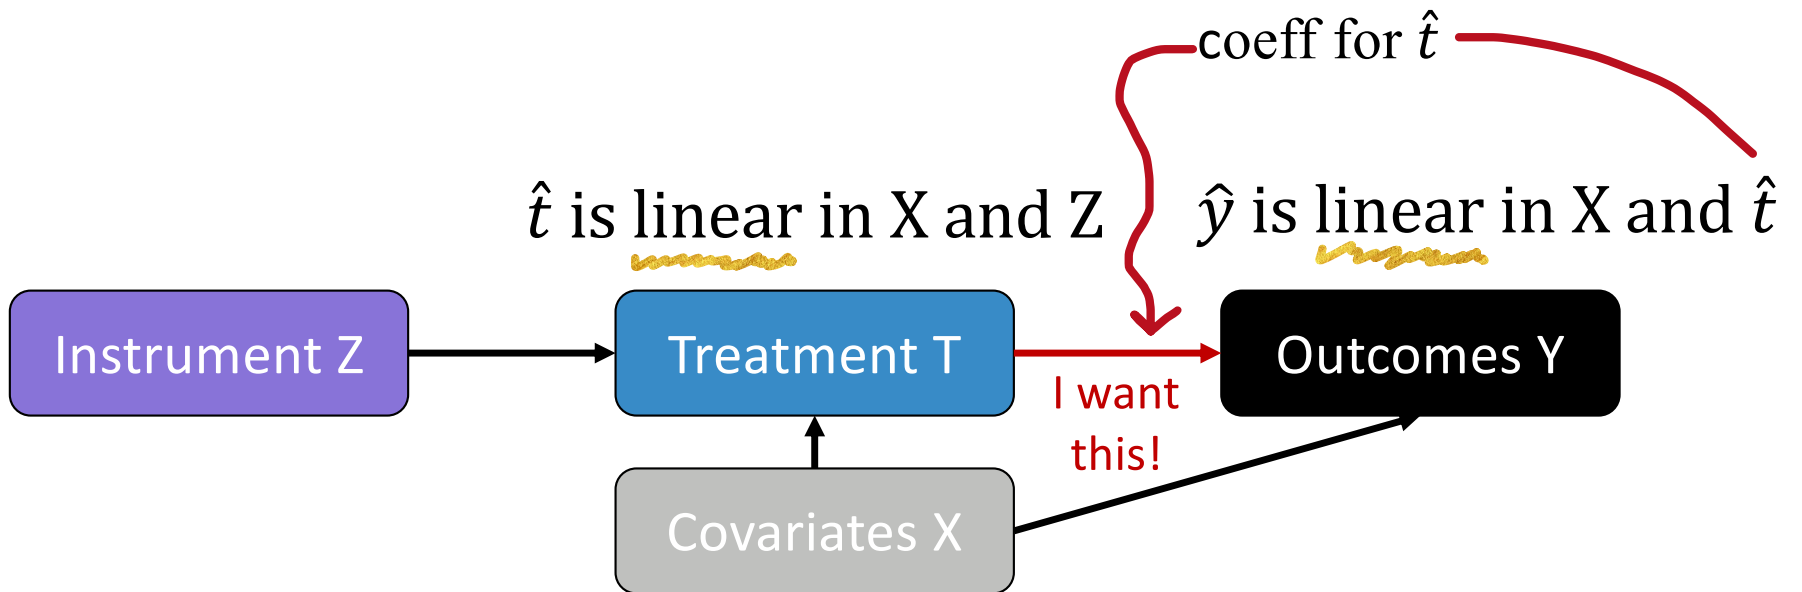

Two Critical Assumptions:

**Relevance Assumption:** variation in the instrument Z leads to meaningful variation in the treatment T

**Exclusion Restriction:** the only source of variation in Y from Z through T

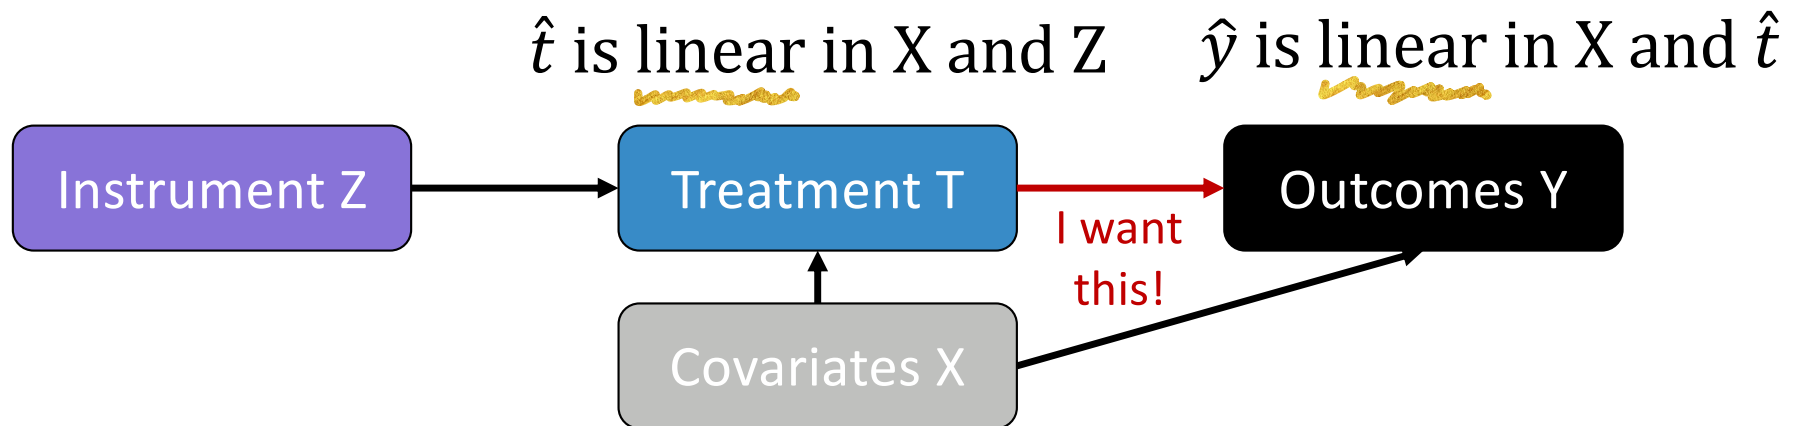

# Traditional Instrumental Variable Analysis

## Traditional Instrumental Variable Analysis

### Exclusion Restriction

Since  $\hat{y}$  contains information about  $Z$  through  $\hat{t}$ ,  
 $\text{Corr}(y - \hat{y}, Z)$  should be 0

# Prediction Validity

- replaces correlation with **prediction**

$\text{Corr}(y - \hat{y}, Z)$  should be 0

Can we predict  $y - \hat{y}$  using  $Z$  and  $X$ ?

# Prediction Validity

- replaces correlation with **prediction**

$\text{Corr}(y - \hat{y}, Z)$  should be 0

Can we predict  $y - \hat{y}$  using  $Z$  and  $X$

better than we can predict  $y - \hat{y}$  with  $\mathbf{0}$ ? No!

Prediction Validity Exclusion Restriction

# Prediction Validity

**Relevance Assumption:** variation in Z leads to variation in T

Can we predict  $t$  using  $X$  and  $Z$  better than  $X$  alone?

Yes!

**Prediction Validity Relevance Assumption!**

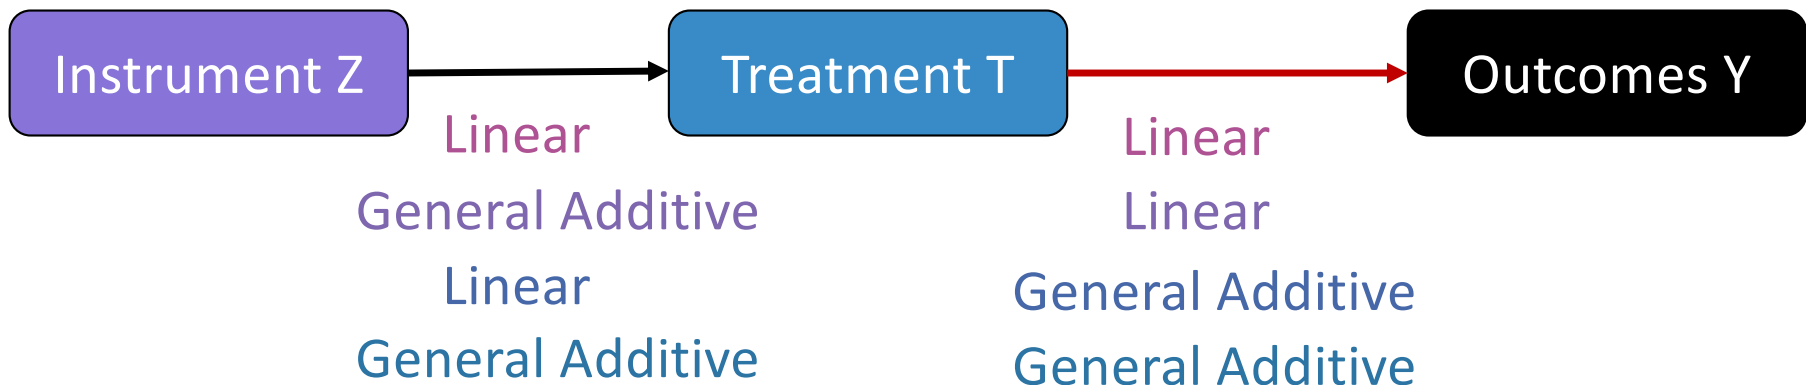

# Prediction Validity

# In the paper

- Introduce prediction validity
- New 2-stage & 1-stage prediction validity instrumental variable analysis
- Feasibility proofs for different model forms
- An application to climate policy perspectives
